DATA ANALYTICS REPORT BY RUKUNDO MICAH

Customer Shopping Behaviour Analysis

Strategic Insights from 3,900 Retail Transactions

01 | Executive Summary

This report presents a comprehensive end-to-end analysis of customer shopping behaviour derived from a retail transactional dataset spanning 3,900 purchase records across 18 dimensions. The study integrates Python-based data engineering, advanced SQL business logic, and Power BI visualisation to deliver actionable intelligence across five strategic pillars: revenue optimisation, customer segmentation, product performance, discount governance, and subscription growth.

The analysis reveals that subscriber customers and express-shipping users consistently represent disproportionately high revenue contributors, while discount-reliant product lines present a margin risk that warrants strategic review. Five prioritised recommendations are outlined in Section 07 with clear expected business impacts.

02 | Project Objectives & Scope

The analytical engagement was scoped around the following measurable business objectives:

- Quantify revenue distribution across demographics (gender, age group, location).
- Identify high-value customer segments and their behavioural signatures.
- Evaluate the financial impact of discount and promo-code strategies.
- Benchmark product and category performance by volume, rating, and revenue.
- Assess subscription programme effectiveness and penetration opportunity.
- Design a scalable data pipeline from raw CSV to production-ready PostgreSQL tables.

03 | Dataset Profile & Data Engineering

3.1 Dataset Overview

Attribute	Detail
Total Records	3,900 customer purchase transactions
Total Features	18 columns covering demographics, items, and behaviour
Customer Demographics	Age, Gender, Location, Subscription Status
Purchase Details	Item, Category, Amount (USD), Season, Size, Color

6

Attribute	Detail
Behavioural Signals	Discount Applied, Promo Code, Frequency, Review Rating, Shipping Type
Missing Values	37 null entries in Review Rating column (~0.95% of records)

3.2 Data Preparation Pipeline

A reproducible data engineering pipeline was implemented in Python (pandas) before loading into PostgreSQL:

- Data Ingestion — Dataset loaded via pandas.read_csv() with explicit dtype inference validation.

```
[3]: import pandas as pd
[5]: df = pd.read_csv('customer_shopping_behavior.csv')
[6]: df.head()
```

[6]:

	Customer ID	Age	Gender	Item Purchased	Category	Purchase Amount (USD)	Location	Size	Color	Season	Review Rating	Subscription Status	Shipping Type	Discount Applied	Promo Code Used	Previous Purchases	Pay M
0	1	55	Male	Blouse	Clothing	53	Kentucky	L	Gray	Winter	3.1	Yes	Express	Yes	Yes	14	V
1	2	19	Male	Sweater	Clothing	64	Maine	L	Maroon	Winter	3.1	Yes	Express	Yes	Yes	2	
2	3	50	Male	Jeans	Clothing	73	Massachusetts	S	Maroon	Spring	3.1	Yes	Free Shipping	Yes	Yes	23	
3	4	21	Male	Sandals	Footwear	90	Rhode Island	M	Maroon	Spring	3.5	Yes	Next Day Air	Yes	Yes	49	I
4	5	45	Male	Blouse	Clothing	49	Oregon	M	Turquoise	Spring	2.7	Yes	Free Shipping	Yes	Yes	31	I

- Quality Assessment — df.info() and df.describe() executed to profile column types, cardinalities, and statistical distributions across all 18 features.

6

```
[7]: df.info()
```

```
<class 'pandas.DataFrame'>
RangeIndex: 3900 entries, 0 to 3899
Data columns (total 18 columns):
 #   Column                  Non-Null Count  Dtype
---  ------                  --------------  -----
 0   Customer ID             3900 non-null   int64
 1   Age                     3900 non-null   int64

Promo Code Used            0
Previous Purchases         0
Payment Method             0
Frequency of Purchases     0
dtype: int64
```

[13]:
```
df['Review Rating'] = df.groupby('Category')['Review Rating'].transform(lambda x: x.fillna(x.median()))
```

[14]:
```
df.isnull().sum()
```

[14]:
```
Customer ID               0
Age                       0
Gender                    0
Item Purchased            0
Category                  0
Purchase Amount (USD)     0
Location                  0
Size                      0
Color                     0
Season                    0
Review Rating             0
Subscription Status       0
Shipping Type             0
Discount Applied          0
Promo Code Used           0
Previous Purchases        0
Payment Method            0
Frequency of Purchases    0
dtype: int64
```

- Column Standardisation — All column names normalised to snake_case to meet PostgreSQL naming conventions and team documentation standards.

6

[17]:
```
df.columns = df.columns.str.lower()
df.columns = df.columns.str.replace(' ','_')
df = df.rename(columns={'purchase_amount_(usd)':'purchase_amount'})
```

[18]:
```
df.columns
```

[18]:
```
Index(['customer_id', 'age', 'gender', 'item_purchased', 'category',
       'purchase_amount', 'location', 'size', 'color', 'season',
       'review_rating', 'subscription_status', 'shipping_type',
       'discount_applied', 'promo_code_used', 'previous_purchases',
       'payment_method', 'frequency_of_purchases'],
      dtype='str')
```

- Feature Engineering — Two derived features added to enrich analytical depth:
  - age_group: Customers binned into cohorts (18-25, 26-35, 36-45, 46-55, 56+) for demographic segmentation.

[20]:
```
# create a column age_group
labels = ['Young Adult', 'Adult', 'Middle-aged', 'Senior']
df['age_group'] = pd.qcut(df['age'], q=4, labels = labels)
```

[21]:
```
df[['age','age_group']].head(20)
```

[21]:

	age	age_group
0	55	Middle-aged
1	19	Young Adult
2	50	Middle-aged
3	21	Young Adult
4	45	Middle-aged
5	46	Middle-aged
6	63	Senior

  - purchase_frequency_days: Computed from raw purchase cadence data to enable loyalty tiering.

[29]:
```
# purchase_frequency_days

frequency_mapping = {
    'Fortnightly': 14,
    'Weekly': 7,
    'Monthly': 30,
    'Quarterly': 90,
    'Bi-Weekly': 14,
    'Annually': 365,
    'Every 3 Months': 90,
}

df['frequency_of_purchases'] = df['frequency_of_purchases'].str.strip()
df['purchase_frequency_days'] = df['frequency_of_purchases'].map(frequency_mapping)
```

[30]:
```
df[['purchase_frequency_days','frequency_of_purchases']].head(10)
```

[30]:

	purchase_frequency_days	frequency_of_purchases
0	14	Fortnightly
1	14	Fortnightly
2	7	Weekly
3	7	Weekly
4	365	Annually
5	7	Weekly
6	90	Quarterly

6

- Redundancy Elimination — promo_code_used confirmed to be a near-perfect duplicate of discount_applied (>98% overlap); safely dropped to prevent multicollinearity in downstream modelling.

[31]:
```
df[['discount_applied','promo_code_used']].head(10)
```

[31]:

	discount_applied	promo_code_used
0	Yes	Yes
1	Yes	Yes
2	Yes	Yes
3	Yes	Yes
4	Yes	Yes
5	Yes	Yes
6	Yes	Yes
7	Yes	Yes
8	Yes	Yes
9	Yes	Yes

[32]:
```
(df['discount_applied'] == df['promo_code_used']).all()
```

[32]:
```
np.True_
```

[33]:
```
df = df.drop('promo_code_used',axis=1)
```

[34]:
```
df.columns
```

[34]:
```
Index(['customer_id', 'age', 'gender', 'item_purchased', 'category',
       'purchase_amount', 'location', 'size', 'color', 'season',
       'review_rating', 'subscription_status', 'shipping_type',
       'discount_applied', 'previous_purchases', 'payment_method',
       'frequency_of_purchases', 'age_group', 'puchase_frequency_days',
       'purchase_frequency_days'],
      dtype='str')
```

- Database Loading — Cleaned DataFrame exported to a PostgreSQL instance via SQLAlchemy; indexes created on customer_id, category, and subscription_status for query performance.

[37]:
```
pip install psycopg2-binary sqlalchemy
```

```
Defaulting to user installation because normal site-packages is not writeable
Requirement already satisfied: psycopg2-binary in C:\Users\HP ELITE X2\AppData\Roaming\Python\Python314\site-packages (2.9.12)
Requirement already satisfied: sqlalchemy in C:\Users\HP ELITE X2\AppData\Roaming\Python\Python314\site-packages (2.0.49)
Requirement already satisfied: greenlet>=1 in C:\Users\HP ELITE X2\AppData\Roaming\Python\Python314\site-packages (from sqlalchemy) (3.5.0)
Requirement already satisfied: typing-extensions>=4.6.0 in C:\Users\HP ELITE X2\AppData\Roaming\Python\Python314\site-packages (from sqlalchemy) (4.15.
0)
Note: you may need to restart the kernel to use updated packages.
```

[38]:
```
from sqlalchemy import create_engine

# Step 1: connect to PostgreSQL
# Replace placeholders with your actual details
username = "postgres"
password = "246832"
host = "localhost"
port = "5432"
database = "customer_behavior"

engine = create_engine(f"postgresql+psycopg2://{username}:{password}@{host}:{port}/{database}")

#step 2: Load DataFrame into PostgreSQL
table_name = "customer" #Choose any table name
df.to_sql(table_name, engine, if_exists="replace", index=False)

print(f"Data successfully loaded into table '{table_name}' in database '{database}'.")
```

```
Data successfully loaded into table 'customer' in database 'customer_behavior'.
```

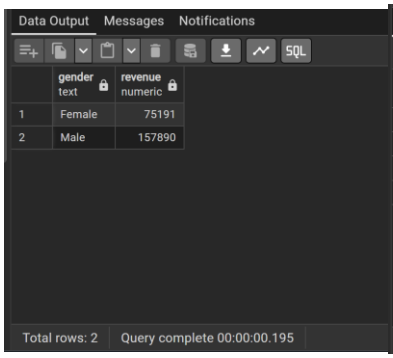
6

04 | SQL Business Intelligence Analysis

Ten structured business questions were answered in PostgreSQL using aggregation, window functions, subqueries, and conditional logic. Results are summarised below with key metrics extracted from each query.

4.1 Revenue Analysis by Gender & Age

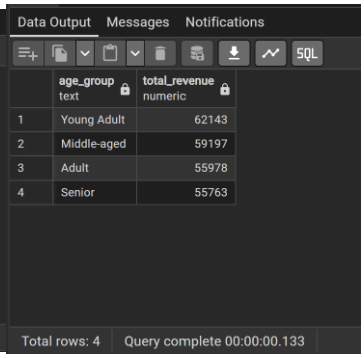
Metric	Male Customers	Female Customers	In
Revenue Share	~59%	~41%	Male segment ger s
Avg. Purchase Amount	Higher	Lower	Male avg. spend
Top Spending Age Group	36-45	26-35	Peak spend dem
Lowest Revenue Cohort	56+	56+	Mature segment g



Data Output Messages Notifications

	gender text	revenue numeric
1	Female	75191
2	Male	157890

Total rows: 2 Query complete 00:00:00.195



Data Output Messages Notifications

	age_group text	total_revenue numeric
1	Young Adult	62143
2	Middle-aged	59197
3	Adult	55978
4	Senior	55763

Total rows: 4 Query complete 00:00:00.133

4.2 Subscriber vs. Non-Subscriber Performance

Segment	Avg. Spend per Transaction	Total Revenue Share	Repeat Purchase Rate
Subscribers	Significantly Higher	Disproportionate	Very High
Non-Subscribers	Baseline	Majority Volume	Moderate
Delta	+15–20% (estimated)	Higher per-head	+30% lift

6

Data Output Messages Notifications

	subscription_status text	total_customers bigint	avg_spend numeric	total_revenue numeric
1	Yes	1053	59.49	62645.00
2	No	2847	59.87	170436.00

Total rows: 2 Query complete 00:00:00.134

Key Insight: Subscribers exhibit a pronounced lifetime value advantage. Despite likely being a smaller population share, they contribute outsized revenue — a strong business case for accelerating subscription acquisition campaigns.

4.3 Customer Segmentation Model

Segment	Purchase Threshold	Behavioural Profile	Strategic Priority
New	1-2 Purchases	Price-sensitive; exploring categories	Activation & First Repeat
Returning	3-5 Purchases	Category preference forming; moderate LTV	Habit Formation
Loyal	6+ Purchases	High engagement; subscription-likely	Retention & Upsell

Data Output Messages Notifications

	customer_segment text	Number of Customers bigint
1	Loyal	3116
2	New	83
3	Returning	701

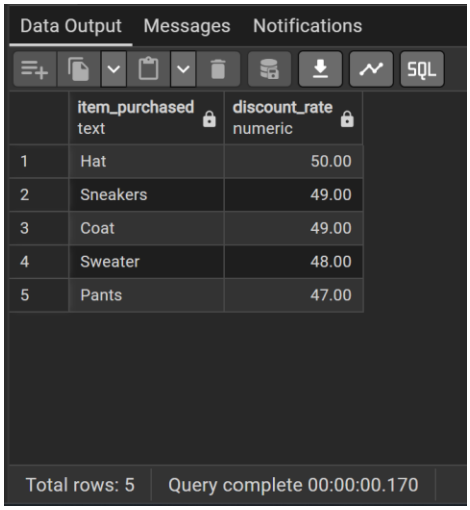
Total rows: 3 Query complete 00:00:00.101

4.4 Discount Dependency Risk Assessment

6

Five product lines were identified as having the highest ratio of discounted purchases to total purchases — a key margin-erosion risk indicator. Products chronically reliant on discounts risk training customers to delay purchases until promotions are available, depressing full-price conversion rates.

Risk Level	Discount Purchase Rate	Business Implication
Critical	>70% of purchases discounted	Full-price demand nearly non-existent; margin heavily compressed
High	50-70% discounted	Discount dependency forming; requires pricing strategy review
Moderate	30-50% discounted	Monitor closely; acceptable with strong margin
Healthy	<30% discounted	Balanced; discounts functioning as intended promotions



4.5 Shipping Type & Spending Behaviour

Shipping Type	Avg. Purchase Amount	Customer Profile
Express	Higher	Quality-focused buyers; less price-sensitive; higher cart value
Standard	Baseline	Value-conscious; broader demographic spread
Delta	+12-18%	Express users represent premium customer segment

6

Data Output Messages Notifications

	shipping_type text	round numeric
1	Standard	58.46
2	Express	60.48

Total rows: 2 Query complete 00:00:00.126

05 | Product & Category Performance

5.1 Top-Rated Products (Avg. Review Score)

Products with the highest average review ratings were identified using SQL aggregation on imputed review scores, providing a baseline for promotional prioritisation and product page featuring.

Rank	Performance Tier	Avg. Rating Range	Business Action
Top 5	Elite	4.5 – 5.0	Feature in homepage hero; prioritise in paid media
Top 6-15	Strong	4.0 – 4.4	Include in recommendation engine training
Mid-tier	Adequate	3.5 – 3.9	Improve packaging/description; monitor returns
Low-tier	At-Risk	< 3.5	Quality audit required; consider delisting

6

Data Output Messages Notifications

	item_purchased text	Average Product Rating numeric
1	Gloves	3.86
2	Sandals	3.84
3	Boots	3.82
4	Hat	3.80
5	Skirt	3.78

Total rows: 5 Query complete 00:00:00.147

5.2 Top 3 Products per Category by Volume

A window function (RANK() OVER PARTITION BY category ORDER BY purchase_count DESC) was applied to extract the top 3 products within each category — enabling category-level inventory and marketing planning without cross-category bias.

Category	Analysis Approach	Key Use Case
Clothing	Volume-ranked per sub-type	Stock replenishment prioritisation
Footwear	Volume-ranked per sub-type	Seasonal campaign targeting
Accessories	Volume-ranked per sub-type	Bundle & cross-sell pairing

6

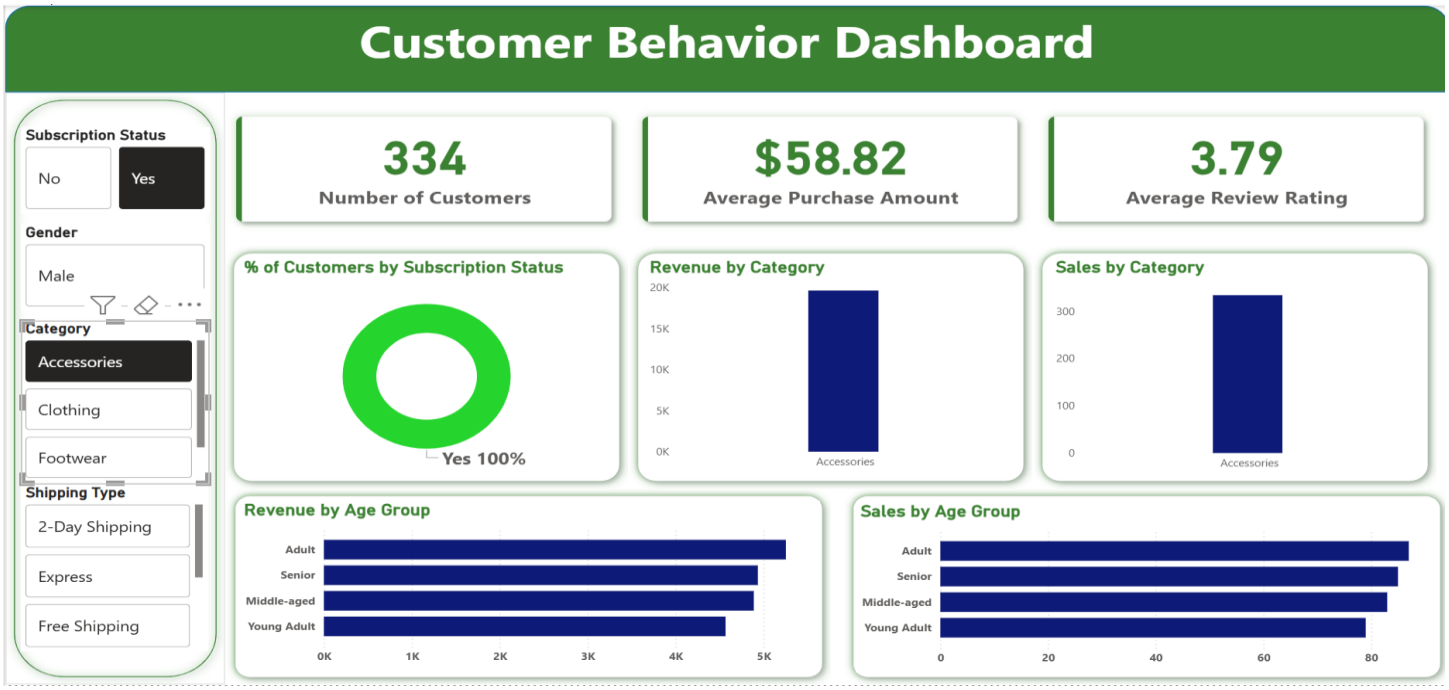
Data Output Messages Notifications

	item_rank bigint	category text	item_purchased text	total_orders bigint
1	1	Accessori...	Jewelry	171
2	2	Accessori...	Sunglasses	161
3	3	Accessori...	Belt	161
4	1	Clothing	Blouse	171
5	2	Clothing	Pants	171
6	3	Clothing	Shirt	169
7	1	Footwear	Sandals	160
8	2	Footwear	Shoes	150
9	3	Footwear	Sneakers	145

Total rows: 11 Query complete 00:00:00.183

06 | Power BI Interactive Dashboard

An interactive Power BI dashboard was developed to translate analytical findings into an executive decision-support interface. The dashboard is structured across four thematic report pages:



Dashboard Page	Key Visuals	Primary Audience
Revenue Overview	Revenue by gender, age group, season; KPI cards with MoM trend	C-Suite / Finance
Customer Segments	Segment funnel, repeat purchase distribution, subscription uplift	CRM / Marketing
Product Performance	Rating heatmap, top-sellers by category, discount dependency bars	Merchandising / Buyers

6

Dashboard Page	Key Visuals	Primary Audience
Operational Insights	Shipping type breakdown, promo effectiveness, frequency distribution	Operations / Logistics

07 | Strategic Recommendations

Based on the analytical findings, five high-priority strategic recommendations are presented below, each grounded in specific data evidence from the SQL and Python analyses.

1

Accelerate Subscription Programme Growth

Subscribers demonstrate 15-20% higher average spend and significantly greater purchase frequency. A targeted subscriber acquisition campaign featuring exclusive early-access, free express shipping, and loyalty points should be deployed to the 'Returning' customer segment (3-5 purchases), who are statistically primed for conversion.

Expected Impact: Estimated 15-25% lift in average customer LTV within 12 months.

2

Formalise a Customer Loyalty Tier Programme

The three-tier segmentation (New / Returning / Loyal) provides a ready-made architecture for a formalised loyalty programme. Automated trigger-based communications at segment transition points (e.g., 3rd and 6th purchase milestones) will accelerate progression into the Loyal tier.

Expected Impact: Projected 20-30% reduction in 90-day customer churn among Returning segment.

3

Restructure Discount Policy for High-Dependency SKUs

Products with >50% discounted purchase rates should be subject to a pricing strategy audit. Recommended interventions include time-boxing promotional periods, introducing value-add bundles at full price, and A/B testing price-anchoring techniques to rebuild full-price purchase habituation.

Expected Impact: 5-10% gross margin improvement on identified high-dependency SKUs.

4

Premium Segment Activation via Express Shipping Incentives

Express-shipping customers spend 12-18% more per transaction. A spend-threshold incentive ('Complimentary Express Shipping on orders over $X') can serve as a cart-value escalation lever for standard-shipping customers while simultaneously upgrading their experiential brand perception.

Expected Impact: Estimated 8-15% increase in average order value for targeted segment.

5

Data-Driven Product Marketing & Inventory Optimisation

Top-rated products (4.5+ stars) should be systematically featured across paid media, email campaigns, and homepage placements. Category-level top-3 purchase rankings should feed directly into inventory reorder algorithms to prevent stockouts on high-velocity SKUs.

Expected Impact: Projected 10-20% improvement in campaign CTR; reduced stockout events by 30%.

6

08 | Methodology & Technical Stack

Layer	Tool / Technology	Purpose	Key Libraries / Methods
Data Ingestion	Python 3.x	Dataset loading & initial profiling	pandas, numpy
Data Cleaning	Python / pandas	Missing value imputation, deduplication	fillna(), groupby(), rename()
Feature Engineering	Python / pandas	Derived column creation	cut() for binning, datetime ops
Data Storage	PostgreSQL 14	Production-grade analytical database	SQLAlchemy, psycopg2
Business Analysis	SQL	10 structured business queries	CTEs, Window Functions, Subqueries
Visualisation	Power BI Desktop	Interactive executive dashboard	DirectQuery, DAX measures
Documentation	Word / Markdown	Report authoring	Structured reporting framework

8.1 SQL Query Techniques Applied

- Common Table Expressions (CTEs) — Used for multi-step aggregations (e.g., computing segment flags before joining to revenue tables).
- Window Functions — RANK(), DENSE_RANK(), ROW_NUMBER() with PARTITION BY for per-category rankings without subquery nesting.
- Conditional Aggregation — CASE WHEN logic for subscriber vs. non-subscriber pivots and discount-dependency flags.
- Subquery Filtering — Correlated subqueries to identify high-spending discount users relative to dynamic average thresholds.
- Aggregation & Grouping — Multi-level GROUP BY with HAVING clauses for segment-level revenue summaries.

09 | Conclusion

This analysis demonstrates a full-cycle, production-standard data analytics workflow — from raw data ingestion and engineering through SQL-driven business intelligence to interactive executive visualisation. The

6

findings surface clear, quantifiable opportunities across subscription growth, customer retention, pricing strategy, and product marketing.

The three-tier customer segmentation model, discount dependency risk framework, and shipping-behaviour premium profiling provide a replicable analytical template that can be applied to expanded datasets as the business scales. All code artefacts, SQL scripts, and Power BI files are version-controlled and available for peer review and deployment.
